CARE INSTRUCTIONS GUIDE

YEY STUDIO

CONTENTS
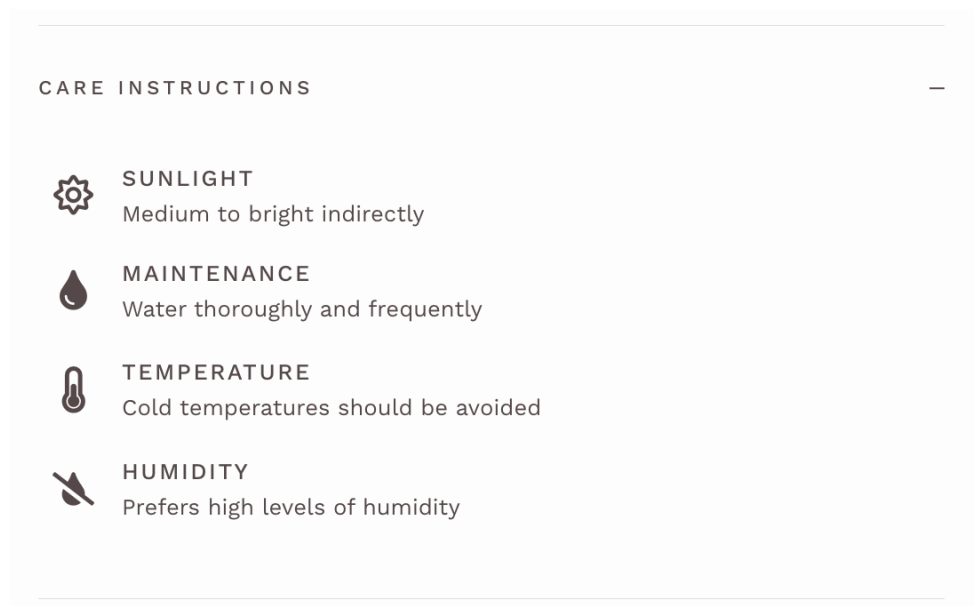

Introduction

Since the care instructions portion of the website was created specifically for <company name> (and is not a service provided by Shopify or your theme) there is no GUI to populate the table in the way that you require.
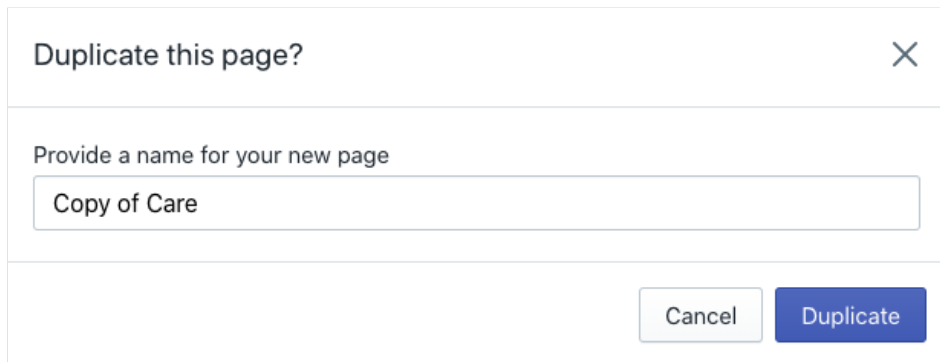

Setting up the tab to appear for the product includes 3 steps.

- Creating a page for each item separately
- Changing the content so as to match the unique product
- Tagging the product in a specific way so that the tab appears

CARE INSTRUCTIONS   —

SUNLIGHT
Medium to bright indirectly

MAINTENANCE
Water thoroughly and frequently

TEMPERATURE
Cold temperatures should be avoided

HUMIDITY
Prefers high levels of humidity

Creating the page

The content for the tab is picked up using the page creator on the shopify backend. Since Shopify allows you to duplicate pages, you may open the page "care" which you can use as a template and press duplicate at the top. You would get a pop-up like so:

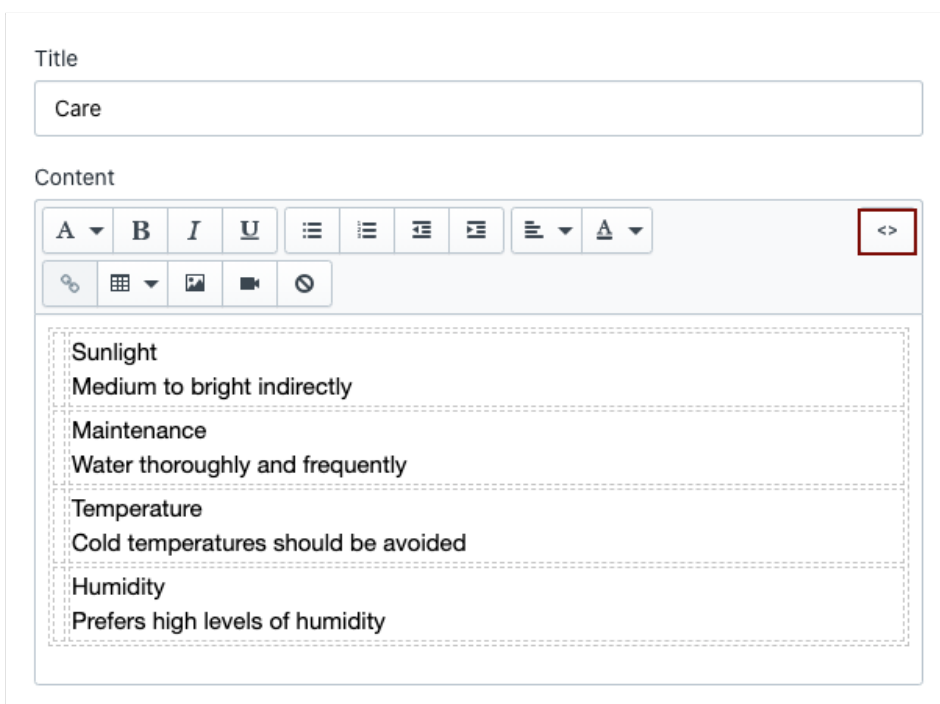

Please make sure that you choose a unique name here since you will be using the handle generated from this to tag your product later. Once your page is created take note of the page handle that you will see when you click edit website SEO. A page needs to be specifically created for every single product that you wish to apply care instructions for.

Changing the content

Please make sure that you don't change the values directly from the WYSIWYG editor because the characters that you use here (such as pressing enter for a newline) will not work, since html is used to create the table.

Instead of editing directly from this view please press the <> icon that you see on the toolbar here.

HTML Code Breakdown

You should now see the HTML code that helps to generate the table on your website.

```
<script src="https://kit.fontawesome.com/cfd9bb9240.js" crossorigin="anonymous"></script>

<table class="care-table">
  <tbody>
    <tr>
      <td><div class="care-icon" style="font-size: 30px;"><i class="far fa-sun"></i></div></td>
      <td><div class="care-title">Sunlight</div>
      <div class="care-detail">Medium to bright indirectly</div></td>
    </tr>
 </tbody>
</table>
```

The first line is the fontawesome kit that enables you to use icon tags throughout the rest of the code. The table is made up of four core elements:

- care-table: Whole table
- care-icon: Icon for the instruction
- care-title: Title heading for the instruction
- care-detail: Detailed text for the instruction

These classes such as care-table, care-icon, care-title and care-details are needed to set the spacings and other CSS elements that will align, format and size your text and icons responsively and so they must be used correctly in order to apply the right formatting to each element. You will be editing the values between the <tbody></tbody> tags and each block would be surrounded by <tr></tr> tags.

Icons

All the icons used for the site are sourced from Fontawesome. Since icons would have different widths, we would need to specify their size using inline CSS attribute **style="font-size: 30px;"**. This will vary depending on the icon and you would need to make sure that the icon size visually fits the current styling or it may look off.

The icon will need to be between <td></td> tags which stands for table data and will need the care-icon class as well as the size as specified above. The tags for icons can be taken from Fontawesome and are between <i></i> tags. For example <i class="far fa-sun"></i> is the icon for sun.

Title

The title is the uppercase header for the instruction. They need the care-title class and are grouped within a single <td></td> tag with the description (since these items are stacked together).

Details

The detail is the actual instruction. They need the care-detail class and are grouped within a single <td></td> tag with the title (since these items are stacked together). In order to not require horizontal scrolling on mobile devices, please make sure that the details are restricted to 35 characters or less per line. If you need to add beyond that, make a new div with the care-detail class within the table data tags line by line. The icon will adjust accordingly, however, it would be best to keep the content short.

!! Please note that deleting any of the required elements could break the section, so ensure that you are only editing the relevant code and using the tags as specified in this document.

For example, a code block with four elements would look like this:

```html
<script src="https://kit.fontawesome.com/cfd9bb9240.js" crossorigin="anonymous"></script>

<table class="care-table">
  <tbody>
    <tr>
      <td>
        <div class="care-icon" style="font-size: 30px;"><i class="far fa-sun"></i></div>
      </td>
      <td>
        <div class="care-title">Sunlight</div>
        <div class="care-detail">Medium to bright indirectly</div>
      </td>
    </tr>
    <tr>
      <td>
        <div class="care-icon" style="font-size: 30px;"><i class="fas fa-tint"></i></div>
      </td>
      <td>
        <div class="care-title">Maintenance</div>
        <div class="care-detail">Water thoroughly and frequently</div>
      </td>
    </tr>
    <tr>
      <td>
        <div class="care-icon" style="font-size: 35px;"><i class="fas fa-thermometer-half"></i></div>
      </td>
      <td>
        <div class="care-title">Temperature</div>
        <div class="care-detail">Cold temperatures should be avoided</div>
      </td>
    </tr>
    <tr>
      <td>
        <div class="care-icon" style="font-size: 25px;"><i class="fas fa-tint-slash"></i></div>
      </td>
      <td>
        <div class="care-title">Humidity</div>
        <div class="care-detail">Prefers high levels of humidity</div>
      </td>
    </tr>
  </tbody>
</table>
```
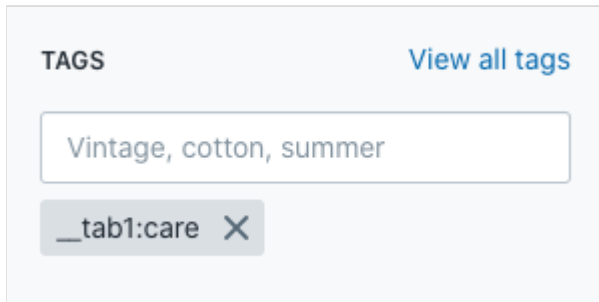

Tagging the product

Once you've created the specific care instruction for your plant, please note down the handle from the page for example 'care'.

From the dashboard head to the product, click on the product you want to add the instructions for and then head to the tags. Please note that you must tag the item in a specific way with double underscores or it won't display the page. The format for the tag is ' __tab1:handle ' so if your page handle is care it would be ' __tab1:care '

(If you wish to bulk edit this information, add the relevant product tags into the tags column of the CSV sheet - column F if you're using the default headers). Once you're done, check to see if the table appears correctly on the changed products and since this is a manual process please ensure that the right information is linked to the product.
